Process Your Documents – Just the Way You Want

MavBridge™ provides a powerful and configurable Document Processing and Indexing Suite that can help you process your documents exactly the way you want. The MavBridge Image Studio Suite of software provides individual modules that are the basic building blocks for any document processing solution—use them individually, or combine them together to form a powerful, customizable solution.

DOCUMENT CLASSIFICATION

Auto Classification	Automatically identify documents using an intelligent combination of OCR, Barcode, Mark Sense and dimensional data.
Manual Classification	Use simple point and click manual classification from image to handle exception documents.
Batch Perfection	Easily correct scanning errors by adjusting transaction boundaries, changing page type, rotating, moving and deleting pages, all from an easy-to-use image-based interface. Enhance and re-threshold images rather than pull and rescan documents.

DOCUMENT INDEXING

Recognition	Read index values from image using OCR, Barcode, and Mark Sense. Automatically adjust for skew and shift. Then, validate data using built-in validation functions.
Key From Image	Use Key From Image modules to capture data that is unreadable using recognition or that requires additional validation. Field level highlight and zoom features make viewing image data and locating fields easy.
Flexible Indexing Options	Select any combination of data fields including dates, batch or sequence numbers as indexes in your system. Use the MavScript™ Editor to generate unique indexes from any combination of data fields.
Configurable Workflow	Configure dynamic workflows based on flexible combinations of job, document and field logic. Easily create workflow queues by job or document type to optimize efficiency within your operation.

RELEASE AND REPORTING

Standard Configurable and Custom Releases	Release images and index data in a wide range of formats using any standard, configurable release scripts such as XML, CSV, PDF, TIFF, X9.37, and ODBC. Select from a wide range of natively supported interfaces for most industry standard ECM solutions.
Multi-Level Reporting	Release index data incrementally as it completes intraday or as a group at the end of a shift. Automatically configure and generate reports for reconciliation.

IMAGE STUDIO SETUP

Image Based	Simply provide an image and begin defining index fields. The drag and drop, intuitive interface makes configuration easy.
Parameter Driven	No programming is required to set up jobs, workflows, documents and index fields. Just click through the options from a tree list and update parameters as needed.
Custom Edits	Take advantage of the custom edit interface to tailor solutions the way you want them.

When this power-pack of Image Studio modules is combined together with Mavro Imaging's Automated Data Enrichment Modules, sites can achieve powerful and flexible end-to-end solutions.
